**ABSTRACT:** There is a digital divide between the general population and “problematic” Drug Users who are often homeless and marginalized. Previous studies showed that Internet could help to decrease social inequalities, as long as it promotes its broadcasting and develops adapted Information Systems. Based on a community research, we proposed, in this article, to promote, on the web, a health monitoring system that aims to reduce social disparities between the general population and Drug Users, an often precarious homeless population, victim of social and digital divide. After a survey conducted in Marseille in 2015 with homeless Drug Users and community actors, we showed that this tool would be adopted by actors who would be involved in its deployment. They see through this system a means of prevention and information, adapted to their needs. The proposed tool enables users to declare themselves data on risks they are undergoing.

## 1. Introduction

Depuis les années 2000, le numérique a révolutionné les travaux de recherches en Sciences Humaines et Sociales (SHS) et a engendré des paradigmes sociaux et culturels qui ont touché les humanités<sup>1</sup>.

De cette révolution digitale, un nouveau champ porteur de méthodes, de dispositifs et de perspectives heuristiques, une nouvelle transdiscipline au
